

Lesson 5 & 6 – Page Design with CSS and the Box Model

CSS page layout techniques allow us to take elements contained in a web page and control where they're positioned relative to the following factors: their default position in normal layout flow, the other elements around them, their parent container, and the main viewport/window.

Look at the following videos before next class.

https://www.youtube.com/watch?v=3C_22eBWpig
<https://www.youtube.com/watch?v=g0db5kA4BfQ>

Also look at the following article that looks at basic layout options that you can work with.

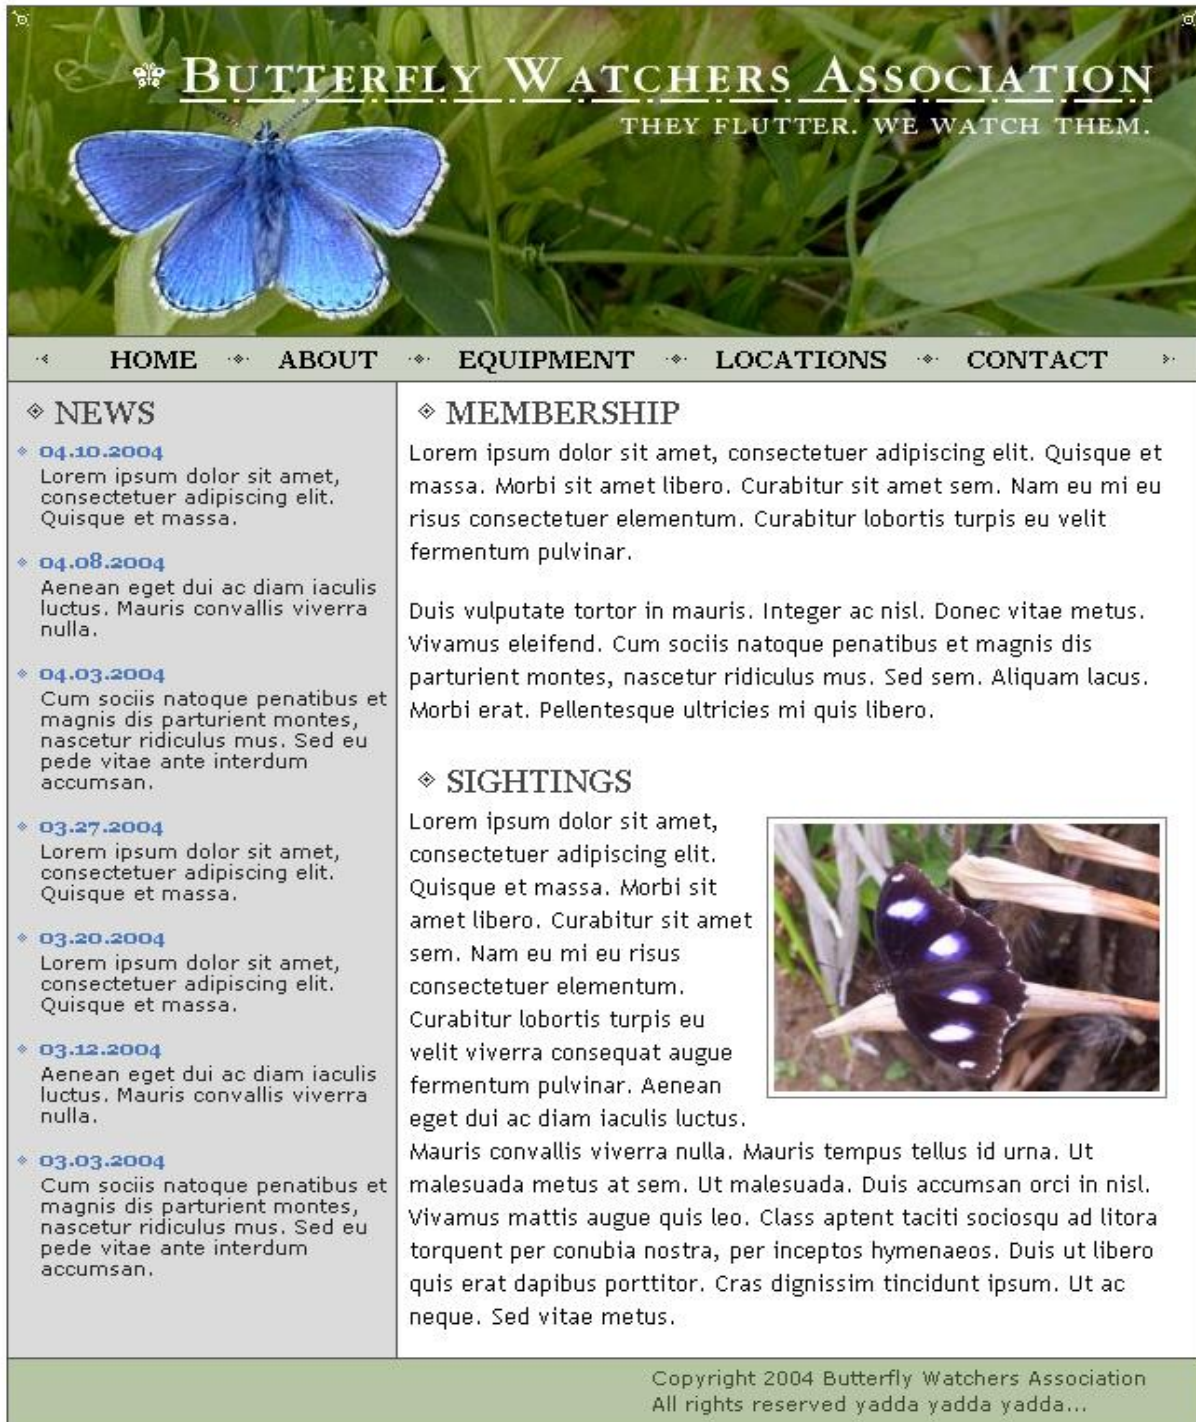

Article - Page Layout.pdf

Plan out and create the following page structures using boxes. Again, we will do the first one as a group. The remaining exercises are for your own personal practice.

Page Layout using the Box Model

Any layout can be divided into boxes, and the content placed in these boxes. Using the following examples, determine the boxes and approximate sizes – based on a 1000px width.

- Determine each box needed using width, height, and colors required.
- Create an HTML and CSS file with all required boxes defined.

HINT: For the links on the top and bottom of the page, create boxes with a top border only for the top links, and the top and bottom border for the 3 links on the bottom.

NOTES: Look at the middle as 3 sections – you can even do the right and left sections as aside's. 3-column layouts are fairly common.
